Linear phase filters are always FIR and have **symmetric** (or, more rarely, **antisymmetric**) coefficients.

$$H(z) = \sum_{m=0}^M h[m]z^{-m} \quad h[M-m] = h[m]$$
$$= h\left[\frac{M}{2}\right] z^{-\frac{M}{2}} + \sum_{m=0}^{\frac{M}{2}-1} h[m] (z^{-m} + z^{m-M}) \quad [m \text{ even}]$$

For  $M$  even, we only need  $\frac{M}{2} + 1$  multiplies instead of  $M + 1$ .  
We still need  $M$  additions and  $M$  delays.

# Linear Phase

Implementation can take advantage of any symmetry in the coefficients.

Linear phase filters are always FIR and have **symmetric** (or, more rarely, **antisymmetric**) coefficients.

$$H(z) = \sum_{m=0}^M h[m]z^{-m} \quad h[M-m] = h[m]$$
$$= h\left[\frac{M}{2}\right] z^{-\frac{M}{2}} + \sum_{m=0}^{\frac{M}{2}-1} h[m] (z^{-m} + z^{m-M}) \quad [m \text{ even}]$$

For  $M$  even, we only need  $\frac{M}{2} + 1$  multiplies instead of  $M + 1$ .  
We still need  $M$  additions and  $M$  delays.

For  $M$  odd (no central coefficient), we only need  $\frac{M+1}{2}$  multiplies.

# Allpass Lattice

We can implement any allpass filter  $H(z) = \frac{z^{-M} A(z^{-1})}{A(z)}$  as a lattice filter with  $M$  stages:

- Initialize  $A_M(z) = A(z)$
- Repeat for  $m = M : -1 : 1$ 
  - $k[m] = a_m[m]$
  - $a_{m-1}[n] = \frac{a_m[n] - k[m]a_m[m-n]}{1 - k^2[m]}$  for  $0 \leq n \leq m - 1$
