- Summary
- Merry Xmas

Phasors obey Ohm's law: $\frac{V_{L}}{I_{L}}=R_{L}=\frac{F_{L}+G_{L}}{Z_{0}^{-1}\left(F_{L}-G_{L}\right)}$
So $G_{L}=\rho_{L} F_{L}$ where $\rho_{L}=\frac{R_{L}-Z_{0}}{R_{L}+Z_{0}}$
At any $x, \frac{G_{x}}{F_{x}}=\frac{G_{L} e^{-j k(L-x)}}{F_{L} e^{+j k(L-x)}}=\rho_{L} e^{-2 j k(L-x)}$
Ohm's law at the load determines the ratio $\frac{G_{x}}{F_{x}}$ everywhere on the line.
Note that $\left|\frac{G_{x}}{F_{x}}\right| \equiv\left|\rho_{L}\right|$ has the same value for all $x$.
$V_{x}=F_{x}+G_{x}=F_{x}\left(1+\rho_{L} e^{-2 j k(L-x)}\right)$

\end{aligned}
$$

## Phasor Reflection

18: Phasors and
Transmission Lines

- Phasors and transmision
lines
- Phasor Relationships
- Phasor Reflection
- Standing Waves
- Summary
- Merry Xmas

Phasors obey Ohm's law: $\frac{V_{L}}{I_{L}}=R_{L}=\frac{F_{L}+G_{L}}{Z_{0}^{-1}\left(F_{L}-G_{L}\right)}$
So $G_{L}=\rho_{L} F_{L}$ where $\rho_{L}=\frac{R_{L}-Z_{0}}{R_{L}+Z_{0}}$
At any $x, \frac{G_{x}}{F_{x}}=\frac{G_{L} e^{-j k(L-x)}}{F_{L} e^{+j k(L-x)}}=\rho_{L} e^{-2 j k(L-x)}$
Ohm's law at the load determines the ratio $\frac{G_{x}}{F_{x}}$ everywhere on the line.
Note that $\left|\frac{G_{x}}{F_{x}}\right| \equiv\left|\rho_{L}\right|$ has the same value for all $x$.
$V_{x}=F_{x}+G_{x}=F_{x}\left(1+\rho_{L} e^{-2 j k(L-x)}\right)$
$I_{x}=Z_{0}^{-1}\left(F_{x}-G_{x}\right)=Z_{0}^{-1} F_{x}\left(1-\rho_{L} e^{-2 j k(L-x)}\right)$
The exponent $-2 j k(L-x)$ is the phase delay from travelling from $x$ to $L$ and back again (hence the factor 2).

## Standing Waves

Forward wave phasor: $F_{x}=F e^{-j k x}$
Backward wave phasor: $G_{x}=\rho_{L} F_{x} e^{-2 j k(L-x)}=\rho_{L} F e^{-2 j k L} e^{+j k x}$
Line Voltage phasor: $V_{x}=F_{x}+G_{x}=F e^{-j k x}\left(1+\rho_{L} e^{-2 j k(L-x)}\right)$
Line Voltage Amplitude: $\left|V_{x}\right|=|F|\left|1+\rho_{L} e^{-2 j k(L-x)}\right| \quad$ varies with $x$ but not $t$

## Standing Waves

Forward wave phasor: $F_{x}=F e^{-j k x}$
Backward wave phasor: $G_{x}=\rho_{L} F_{x} e^{-2 j k(L-x)}=\rho_{L} F e^{-2 j k L} e^{+j k x}$
Line Voltage phasor: $V_{x}=F_{x}+G_{x}=F e^{-j k x}\left(1+\rho_{L} e^{-2 j k(L-x)}\right)$
Line Voltage Amplitude: $\left|V_{x}\right|=|F|\left|1+\rho_{L} e^{-2 j k(L-x)}\right| \quad$ varies with $x$ but not $t$
Max amplitude equals $1+\left|\rho_{L}\right|$ at values of $x$ where $F_{x}$ and $G_{x}$ are in phase. This occurs every $\frac{\lambda}{2}$ away from $L$

## Standing Waves

Forward wave phasor: $F_{x}=F e^{-j k x}$
Backward wave phasor: $G_{x}=\rho_{L} F_{x} e^{-2 j k(L-x)}=\rho_{L} F e^{-2 j k L} e^{+j k x}$
Line Voltage phasor: $V_{x}=F_{x}+G_{x}=F e^{-j k x}\left(1+\rho_{L} e^{-2 j k(L-x)}\right)$
Line Voltage Amplitude: $\left|V_{x}\right|=|F|\left|1+\rho_{L} e^{-2 j k(L-x)}\right| \quad$ varies with $x$ but not $t$
Max amplitude equals $1+\left|\rho_{L}\right|$ at values of $x$ where $F_{x}$ and $G_{x}$ are in phase. This occurs every $\frac{\lambda}{2}$ away from $L$ where $\lambda$ is the wavelength, $\lambda=\frac{2 \pi}{k}=\frac{u}{f}$.

## Standing Waves

Forward wave phasor: $F_{x}=F e^{-j k x}$
Backward wave phasor: $G_{x}=\rho_{L} F_{x} e^{-2 j k(L-x)}=\rho_{L} F e^{-2 j k L} e^{+j k x}$
Line Voltage phasor: $V_{x}=F_{x}+G_{x}=F e^{-j k x}\left(1+\rho_{L} e^{-2 j k(L-x)}\right)$
Line Voltage Amplitude: $\left|V_{x}\right|=|F|\left|1+\rho_{L} e^{-2 j k(L-x)}\right| \quad$ varies with $x$ but not $t$
Max amplitude equals $1+\left|\rho_{L}\right|$ at values of $x$ where $F_{x}$ and $G_{x}$ are in phase. This occurs every $\frac{\lambda}{2}$ away from $L$ where $\lambda$ is the wavelength, $\lambda=\frac{2 \pi}{k}=\frac{u}{f}$.

Min amplitude equals $1-\left|\rho_{L}\right|$ at values of $x$ where $F_{x}$ and $G_{x}$ are out of phase.

## Standing Waves

Forward wave phasor: $F_{x}=F e^{-j k x}$
Backward wave phasor: $G_{x}=\rho_{L} F_{x} e^{-2 j k(L-x)}=\rho_{L} F e^{-2 j k L} e^{+j k x}$
Line Voltage phasor: $V_{x}=F_{x}+G_{x}=F e^{-j k x}\left(1+\rho_{L} e^{-2 j k(L-x)}\right)$
Line Voltage Amplitude: $\left|V_{x}\right|=|F|\left|1+\rho_{L} e^{-2 j k(L-x)}\right| \quad$ varies with $x$ but not $t$
Max amplitude equals $1+\left|\rho_{L}\right|$ at values of $x$ where $F_{x}$ and $G_{x}$ are in phase. This occurs every $\frac{\lambda}{2}$ away from $L$ where $\lambda$ is the wavelength, $\lambda=\frac{2 \pi}{k}=\frac{u}{f}$.

Min amplitude equals $1-\left|\rho_{L}\right|$ at values of $x$ where $F_{x}$ and $G_{x}$ are out of phase.
Standing waves arise whenever a periodic wave meets its reflection: e.g. ponds, musical instruments, microwave ovens.
